DEVELOPING TRANSFORMATIVE THERAPIES FOR RETINAL DISEASES

November 2021

NASDAQ: ISEE

Forward looking statements

Any statements in this presentation about the Company's expectations, plans and prospects constitute forward-looking statements for purposes of the safe harbor provisions under the Private Securities Litigation Reform Act of 1995. Forward-looking statements include any statements about the Company's strategy, future operations and future expectations, plans and prospects, and any other statements containing the words "anticipate," "believe," "estimate," "expect," "intend", "goal," "may", "might," "plan," "predict," "project," "seek," "target," "potential," "will," "would," "could," "should," "continue," and similar expressions.

In this presentation, the Company's forward looking statements include statements about its expectations regarding availability of top-line data from and patient retention in its second Phase 3 trial (GATHER2) of Zimura in geographic atrophy secondary to AMD, its ability to use its completed clinical trial of Zimura for the treatment of geographic atrophy secondary to AMD (GATHER1) as a Phase 3 trial for purposes of seeking regulatory approval, its development and regulatory strategy for Zimura and its other product candidates, including additional indications, such as intermediate AMD, that the Company may pursue for the development of Zimura and IC-500, its ability to obtain the first marketing approval for the treatment of geographic atrophy and its expectations regarding the market dynamics for the treatment of GA and other commercial matters, the Company's hypotheses regarding complement inhibition and HtrA1 inhibition as potential mechanisms of action for the treatment of retinal diseases, the implementation of its business and hiring plan, expectations regarding its cash and financial resources, the timing, progress and results of clinical trials and other research and development activities, including regulatory submissions, the clinical meaningfulness of clinical trial results, the potential utility of its product candidates, estimates regarding the number of patients affected by the diseases and indications the Company's product candidates are intended to treat and statements regarding the potential for the Company's business development strategy.

Such forward-looking statements involve substantial risks and uncertainties that could cause the Company's research and development programs, future results, performance or achievements to differ significantly from those expressed or implied by the forward-looking statements. Such risks and uncertainties include, among others, those related to the progression and duration of the COVID-19 pandemic and responsive measures thereto and related effects on the Company's research and development programs, operations and financial position, expectations for regulatory matters, the initiation and the progress of research and development programs and clinical trials, including enrollment and retention in clinical trials, availability of data from these programs, reliance on contract development and manufacturing organizations, contract research organizations and other third parties, establishment of manufacturing capabilities, developments from the Company's competitors and the marketplace for the Company's products, human capital matters, need for additional financing and other factors discussed in the "Risk Factors" section contained in the quarterly and annual reports that the Company files with the Securities and Exchange Commission.

Any forward-looking statements represent the Company's views only as of the date of this presentation. The Company anticipates that subsequent events and developments may cause its views to change. While the Company may elect to update these forward-looking statements at some point in the future, the Company specifically disclaims any obligation to do so except as required by law.

IVERIC BIO

Positioned to be the leader in retina

Therapeutics for Age-Related Retinal Diseases (Large Market)

- Zimura (C5 inhibitor):
  - Positive data for the first of two Phase 3 trials (GATHER1)
    - Statistically significant 27% reduction in GA growth over 12 months (primary endpoint achieved)
  - Completed patient enrollment for second Phase 3 trial (GATHER2) in July 2021; topline data expected in 2H2022
  - Received Special Protocol Assessment (SPA) from FDA for GATHER2
  - Plan to file for NDA/MAA approvals following positive 12-month GATHER2 data
  - Commercial planning underway; potential for market leading position
    - Hired Chief Commercial Officer and Commercial Leadership Team
  - Plan to initiate clinical development in intermediate AMD in 2022 with additional lifecycle initiatives ongoing
- IC-500 (HtrA1 Inhibitor): Complementary MOA adding to development stage AMD franchise

Cash Position

- Expected YE 2021 cash: $375 million - $385 million*

*Estimate as of 11/9//21

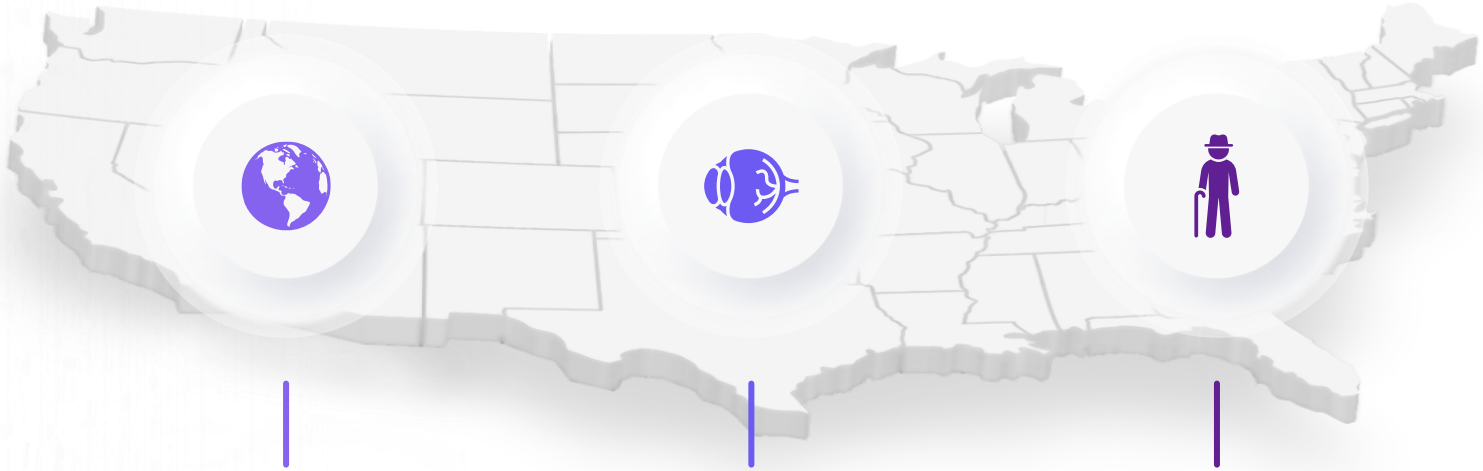
GA severely impacts vision in ~1.5 million patients in the US alone



Leading cause of central vision loss in individuals over 50 years old in developed countries[1]

Severely affects vision and often threatens complete vision loss in an estimated **1.5 million** individuals in the United States and **5 million** individuals worldwide[2]

Early signs of retinal changes are seen in individuals as young as **30–40 years old**[3]

Studies show **GA severity increases with age**[1]

One-third of the population is affected by GA by the time individuals are 80 years old[3]

GATHER1: Key Inclusion Criteria

- Non-foveal GA secondary to dry AMD
- Total GA area ≥ 2.5 and ≤ 17.5 mm^2 (1 and 7 disk areas [DA] respectively), determined by screening images of FAF
- If GA is multifocal, at least one focal lesion should measure ≥ 1.25 mm^2 (0.5 DA)
- GA in part within 1500 microns from the foveal center
- The atrophic lesion must be able to be photographed in its entirety
- Best corrected visual acuity in the SE between 20/25 – 20/320, inclusive

IVERIC BIO

GATHER1: Primary efficacy endpoint achieved

Mean Rate of Change in Geographic Atrophy (GA) Area from Baseline to Month 12 (MRM Analysis) (Square Root Transformation, ITT Population)

Cohort	Zimura 2mg (N=67)	Sham 2mg (N=110)	Difference	P-value	% Difference
Mean Change in GA[a]	0.292[c]	0.402[c]	0.110	0.0072[b]	27.38%

IVERIC BIO

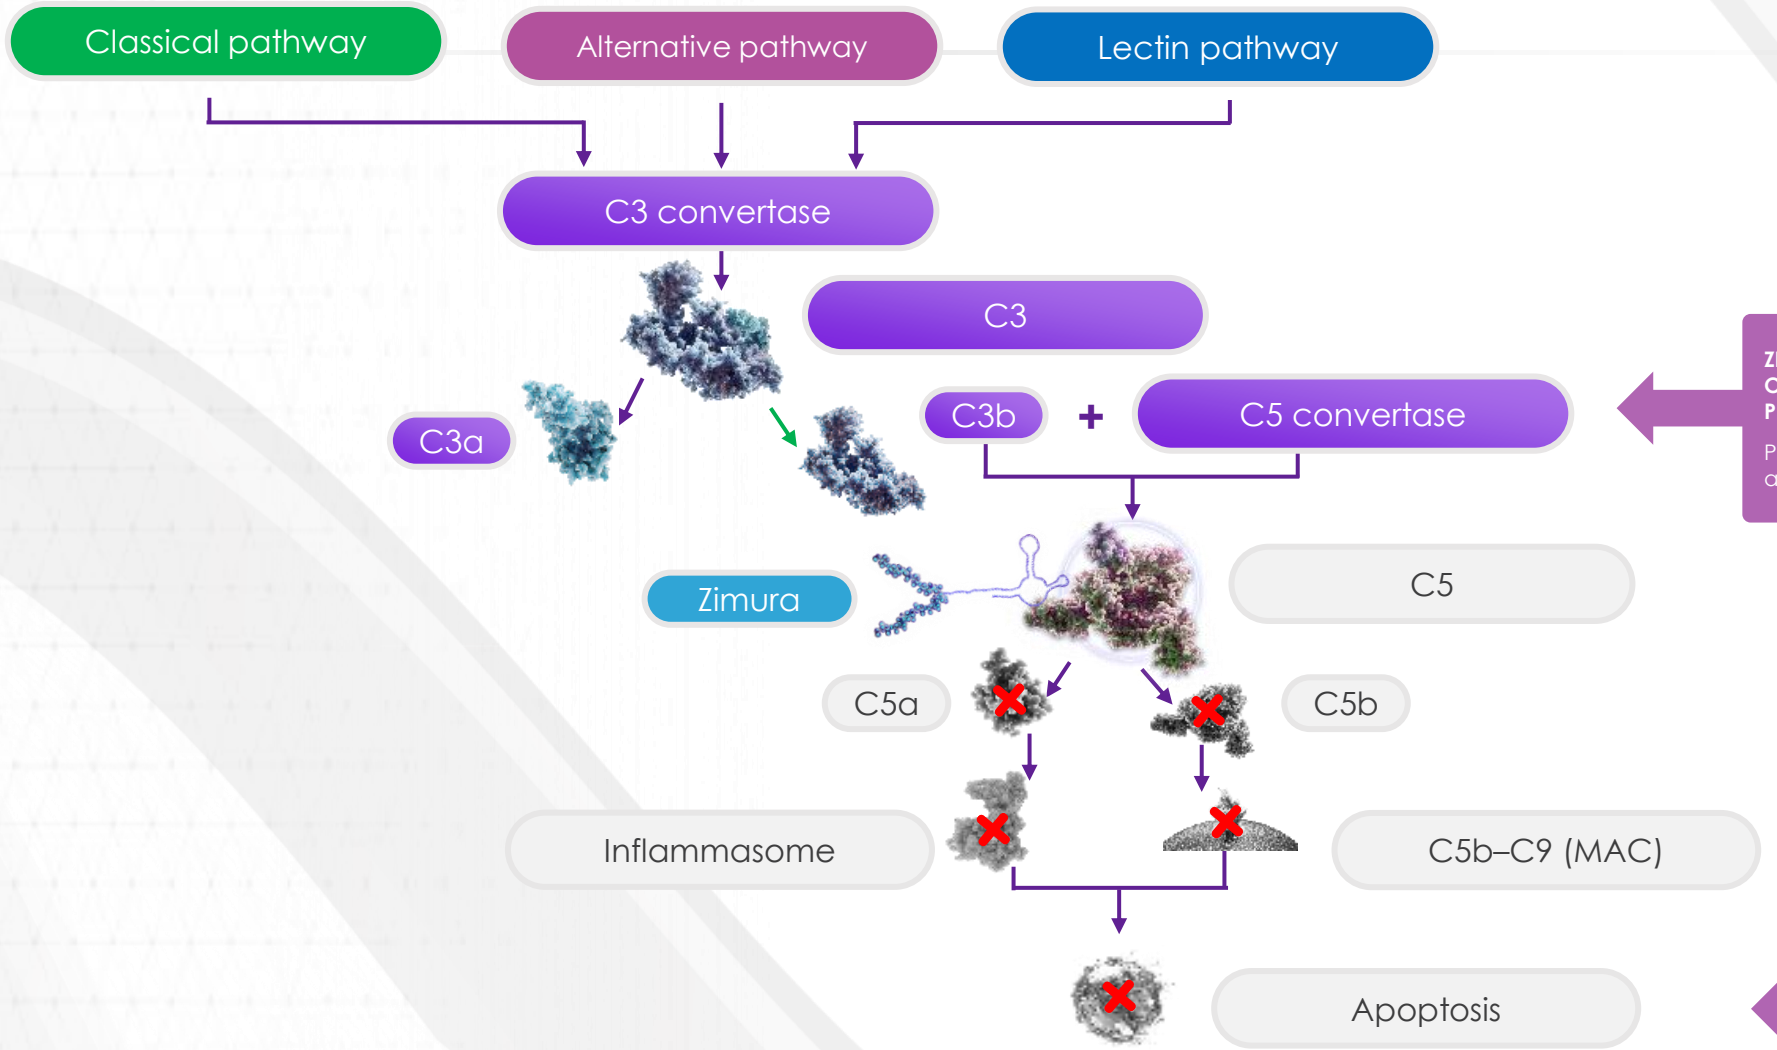
INHIBITION OF C5

What Are The Potential Advantages of Inhibiting the Complement System at C5?

Zimura targets C5, inhibiting the 2 triggers of cell death, preserving the remainder of the pathway



ZIMURA BYPASSES C3, PRESERVING OPSONIZATION AND PERFUSION WHILE PROVIDING NEUROPROTECTION

Promotes phagocytosis of antigens and apoptotic cells

BY INHIBITING C5, ZIMURA IS HYPOTHESIZED TO PREVENT APOPTOSIS

IVERIC BIO

Xu H, Chen M. Targeting the complement system for the management of retinal inflammatory and degenerative diseases. *European Journal of Pharmacology*. 2016;787:94-104.

Inhibition at C5: Potential safety advantages

- Complement C3a receptors play roles in endotoxemia, ischemia-reperfusion, neurotrauma and ALS models
- C3aR is protective in these models (knockout worsens disease)
- C3-CR3 is also protective in a retinal degeneration model
- Global blockade of C3, as opposed to C5, may prevent the beneficial activities of C3a, while also increasing infection risk

Inhibition at C5: Potential safety advantages

"Deficiency of C3 or CR3 decreased microglial phagocytosis of apoptotic photoreceptors and increased microglial neurotoxicity to photoreceptors,…"

C3- and CR3-dependent microglial clearance protects photoreceptors in retinitis pigmentosa

JEM Journal of Experimental Medicine

Sean M. Silverman, Wenxin Ma, Xu Wang, Lian Zhao, and Wai T. Wong

Complement activation has been implicated as contributing to neurodegeneration in retinal and brain pathologies, but its role in retinitis pigmentosa (RP), an inherited and largely incurable photoreceptor degenerative disease, is unclear. We found that multiple complement components were markedly up-regulated in retinas with human RP and the rd10 mouse model, coinciding spatiotemporally with photoreceptor degeneration, with increased C3 expression and activation localizing to activated retinal microglia. Genetic ablation of C3 accelerated structural and functional photoreceptor degeneration and altered retinal inflammatory gene expression. These phenotypes were recapitulated by genetic deletion of CR3, a microglia-expressed receptor for the C3 activation product iC3b, implicating C3-CR3 signaling as a regulator of microglia–photoreceptor interactions. Deficiency of C3 or CR3 decreased microglial phagocytosis of apoptotic photoreceptors and increased microglial neurotoxicity to photoreceptors, demonstrating a novel adaptive role for complement-mediated microglial clearance of apoptotic photoreceptors in RP. These homeostatic neuroinflammatory mechanisms are relevant to the design and interpretation of immunomodulatory therapeutic approaches to retinal degenerative disease.

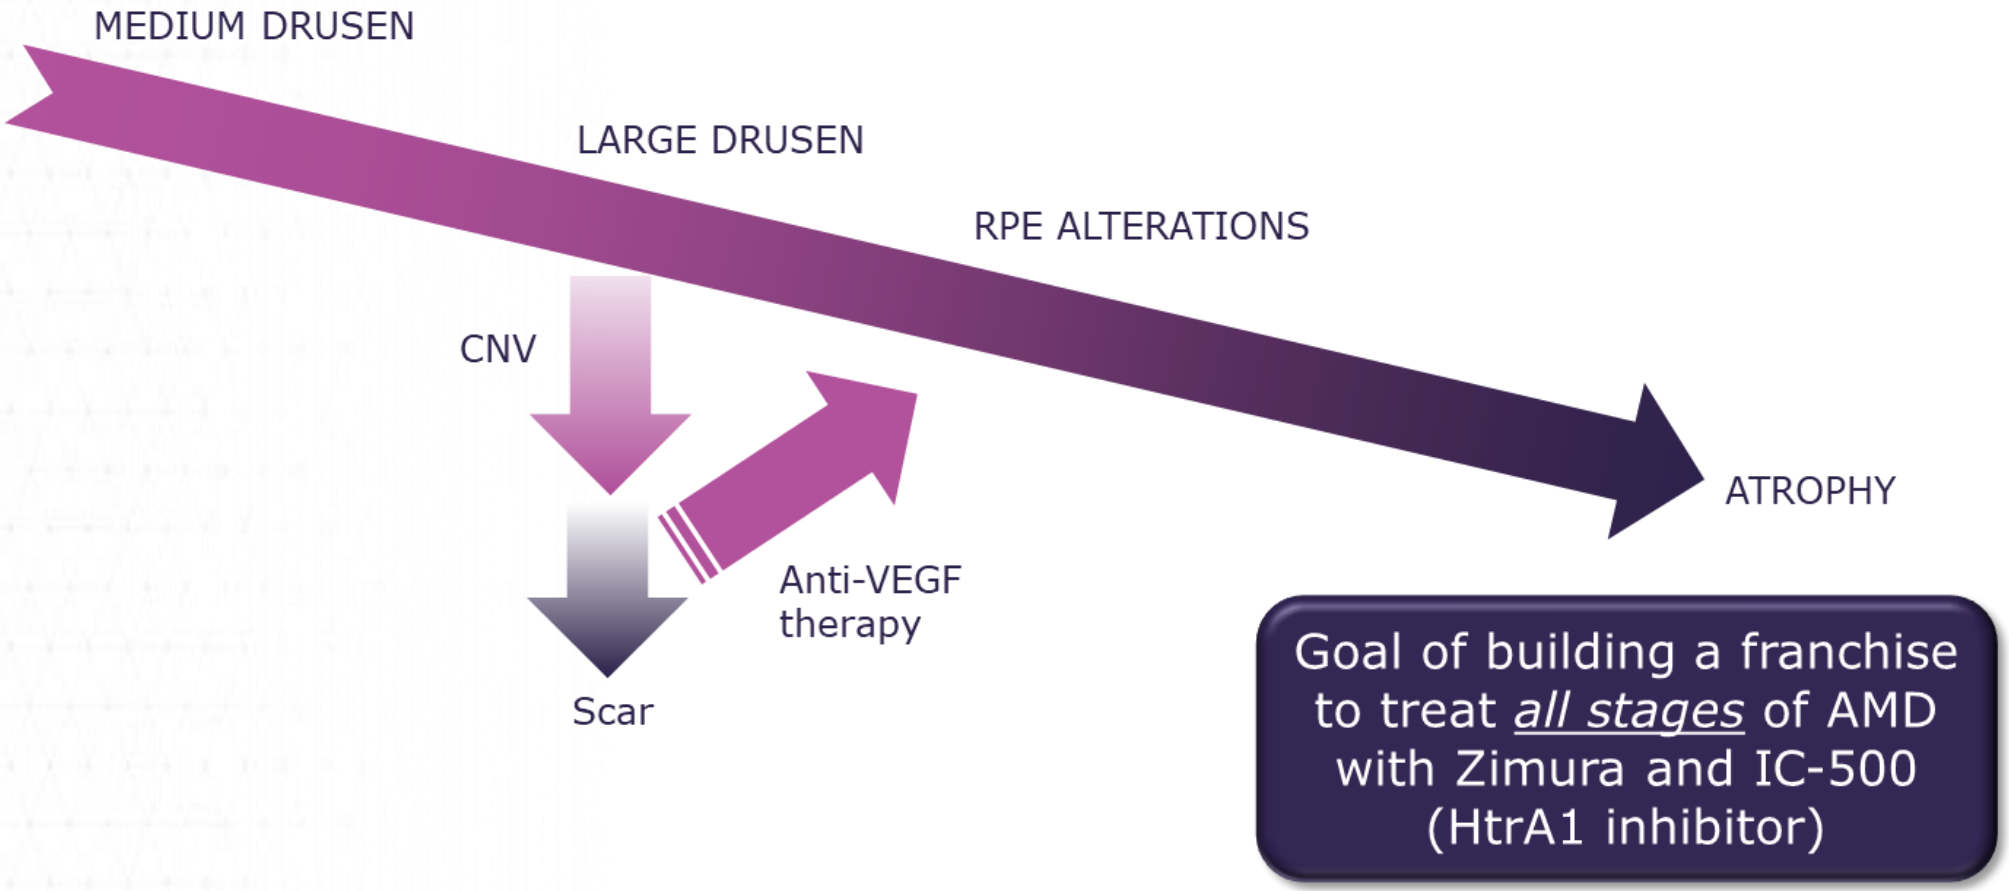
Pathway of AMD disease progression



IVERIC BIO

Ophthalmology. 2017 Jan; 124(1): 97–104; Lancet. 2018 Sep 29;392(10153):1147-1159; Retina. 2016 Oct;36(10):1843-50; Am J Ophthalmol. 2015 May;159(5):915-24

De-risking perspectives on Zimura

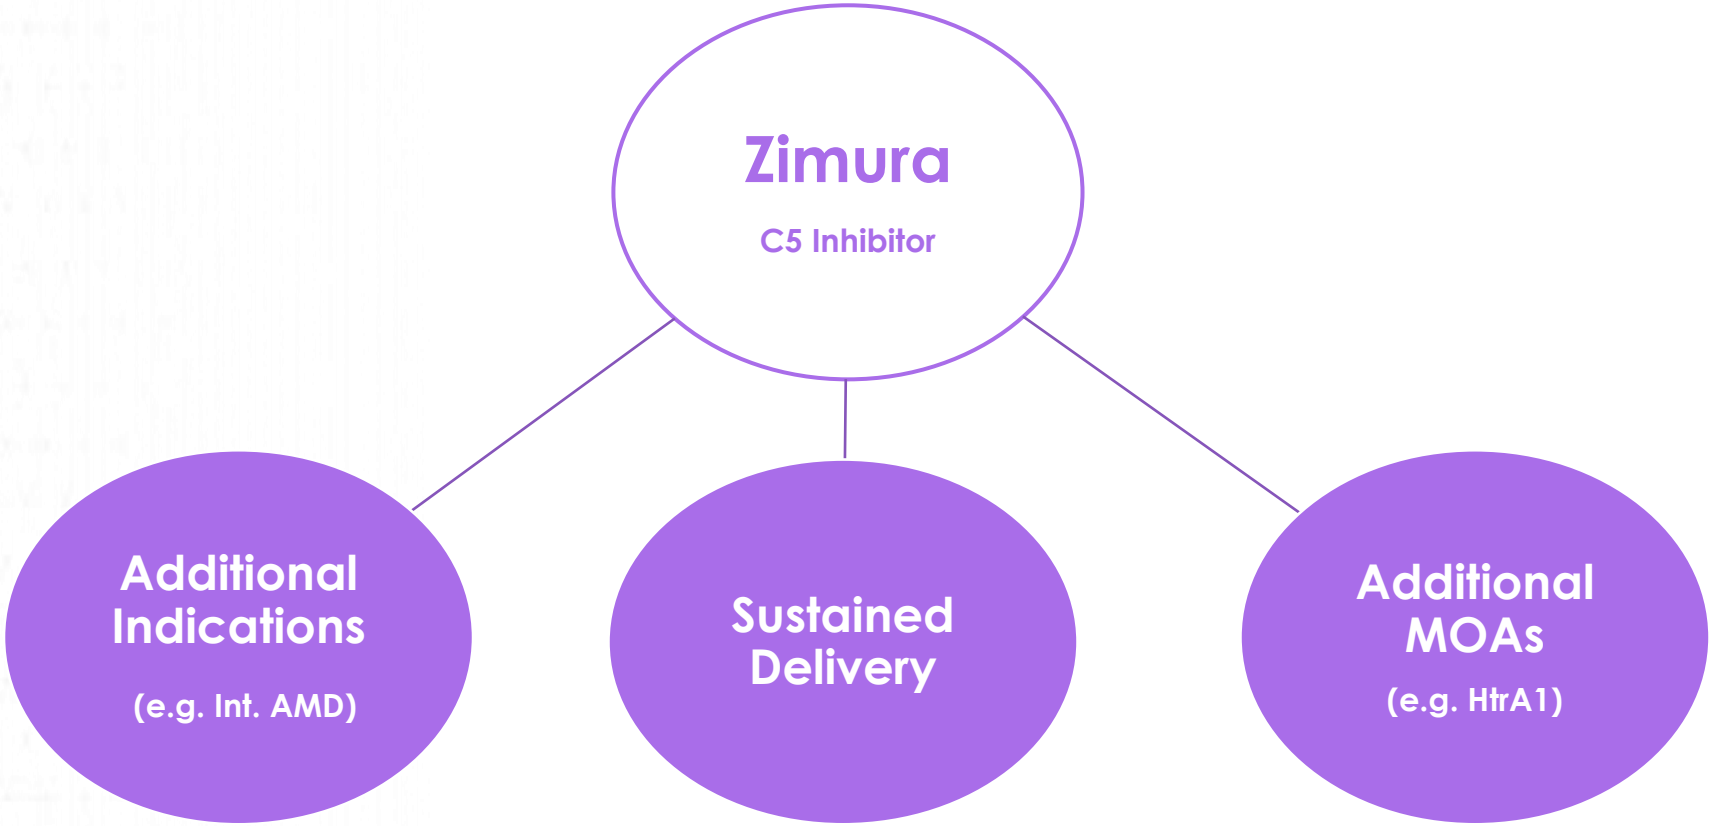
- GATHER1 is the first successful pivotal trial in GA, with an early and continuously increasing treatment effect observed over 18 months
- Recent Phase 3 data from a competitor suggests inhibiting downstream in the complement cascade is a viable therapeutic approach to addressing GA
- Data may also suggest that treating earlier (i.e. extrafoveal lesions) with a complement inhibitor may have added benefit as opposed to treating later stage disease (i.e. foveal-involving)
- GATHER1 post-hoc analyses suggests that Zimura may have the potential to impact AMD earlier in the disease (i.e. drusen, iRORA, cRORA), thereby changing the natural course of the disease

IVERIC BIO

IVERIC BIO

BUILDING AN AMD FRANCHISE

Lifecycle Management Strategy



IVERIC BIO

Intermediate AMD: Planned Phase 3 Trial Design

- International, randomized, double-masked, sham-controlled, multi-center Phase 3 clinical trial with ~200 patients per treatment group
- Dosing regimens currently under consideration
- Patients treated and followed for 24 months
- Inclusion criteria (definition of "Intermediate AMD") / primary efficacy endpoint:
  - Based on imaging criteria and anatomic features
- Plans subject to regulatory feedback prior to trial initiation
- Potential to file sNDA/MAA based on results from this pivotal trial and supportive data

IVERIC BIO

Evidence for the role of HtrA1 in AMD pathogenesis

Target backed by strong human genetic and pre-clinical/clinical evidence

- Strong human genetic evidence associates ocular HtrA1 overexpression with geographic atrophy and all neovascular forms of AMD
- Compelling preclinical and clinical evidence for role of HtrA1 in AMD
- HtrA1 is non-overlapping and could augment the effects of targeting other AMD treatment pathways

IVERIC BIO

Proposed mechanism of HtrA1 activity in AMD

Destruction of extracellular matrix proteins leads to epithelium dysfunction

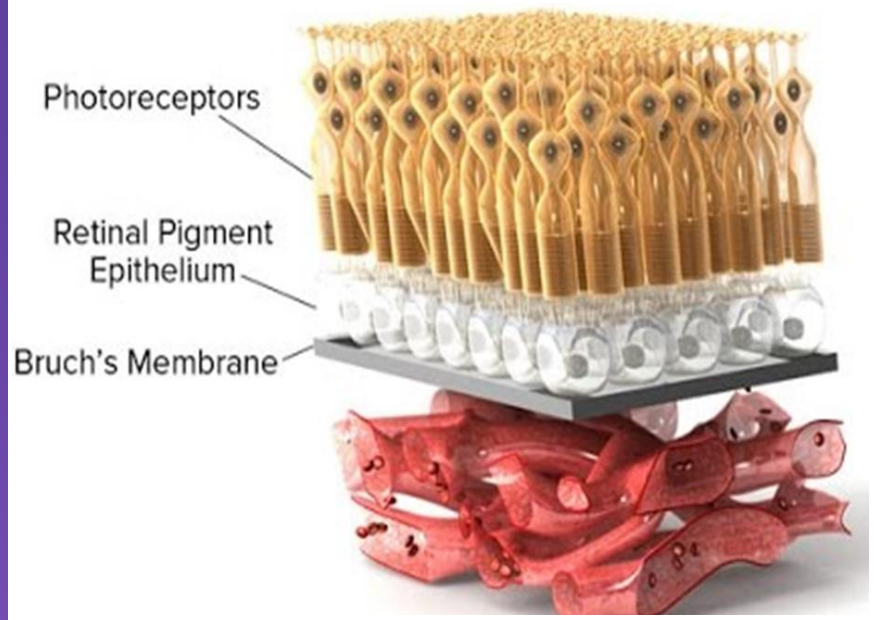
Increased HtrA1 protease activity

Destruction of structural and regulatory extracellular proteins, and intracellular proteins

- Loss of key BM, RPE, and choroid functions
- Upregulation of non-VEGF angiogenic and pro-inflammatory factors

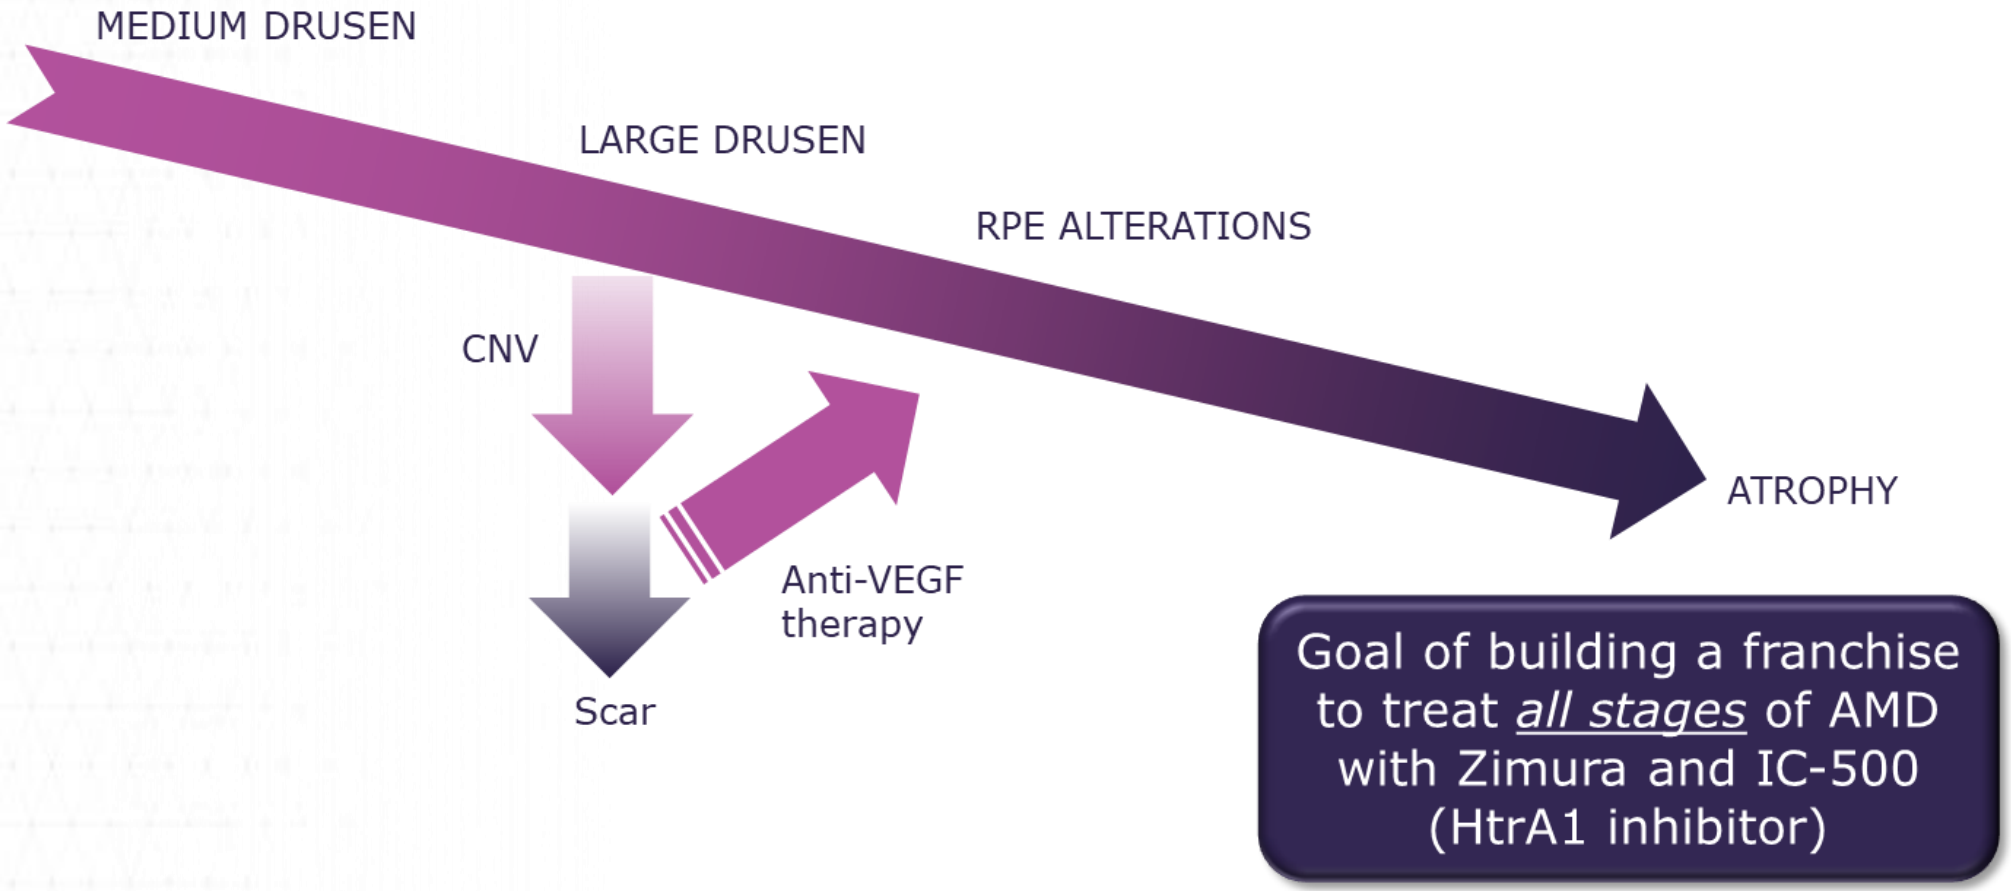
RPE, Bruch's membrane, and choroidal dysfunction

AMD development and progression



IVERIC BIO

Multiple shots on goal in AMD



IVERIC BIO

Ophthalmology. 2017 Jan; 124(1): 97–104; Lancet. 2018 Sep 29;392(10153):1147-1159; Retina. 2016 Oct;36(10):1843-50; Am J Ophthalmol. 2015 May;159(5):915-24

Recent and planned milestones

- ✓ GATHER2 enrollment completed (July 2021)
- ✓ Hired Chief Commercial Officer (August 2021)
- ✓ Initiate Phase 3 clinical trial of Zimura in intermediate AMD (2022)
- ✓ GATHER2 topline data readout (2H 2022)
- ✓ IC-500 IND submission (2H 2022)

IVERIC BIO

Summary

- GATHER1 is the first known successful pivotal trial for GA
- If positive, we expect GATHER2 will be the final pivotal trial required for FDA and EMA approval for GA
- Zimura has the potential to impact earlier stages of AMD
- We believe we are well positioned to expand Zimura's indications, build an AMD franchise and, subject to regulatory approval, commercialize Zimura for GA as a market leader

Mixed-Effect Repeated Measures Model

- Used to assess the differences between Zimura 2mg or 4mg dose and their corresponding sham in rate of change of GA area (square-root transformation) over 12 months
- The model included the following fixed and random effects:
  - Treatment: Sham vs dose
  - Study part (1 vs 2): only for 2 mg
  - Baseline VA: < 50 letters vs ≥ 50 letters
  - Size of baseline GA: < 4 disc area vs ≥ 4 disc area
  - Pattern of FAF at the junctional zone of GA: none/focal vs banded/diffuse
  - Visit (0, 6 mos or 12 mos) with unstructured correlation
  - Interaction terms between visit and all other factors
